Abstract (en)  
[origin: WO9903587A1] The invention concerns a mill comprising a cylindrical frame (16) lined with an inner armour and designed to receive the material to be crushed and a load of milling machines wherein the shell, which consists of juxtaposed individual armour plate rings, has inner longitudinal lifting sections to lift the load and the material to be crushed when the mill rotates. In order to adapt the lifting section to the mill operating parameters and conditions, each plate has, on its rear surface, viewed in the mill rotating direction, a step (10b, 12b, 14b) radially higher than the front surface and each ring of the plates comprises several types of different plates (10, 12, 14) which are different at least in their step (10b, 12b 14b) radial height and which follow one another, in the circumferential direction, according to a predetermined order.
