Abstract (en)

In at least an operating phase of the programme, water is let into the washing vessel (4) up to a static level (S) which is higher than the level of a recirculation filter (12, 13), a recirculating pump (10) is switched on, the water is at a certain point let partially off the vessel down to a static level (S1) which is lower than the level of the filter (12, 13), and the recirculating pump is switched on again. The performance of the recirculation filter (12) is thereby improved. <IMAGE>
