Abstract (en)

A safety lock for electrical devices, particularly for electrical switches, includes a base body, a sliding body, which can move along the longitudinal axis of the base body, and a hook member which is stationary with respect to the base body and determines at least two positions: a closed position, in which the hook member engages a control member (3) of an electrical device, so as to prevent its functional movement, and an open position, in which the hook member can be disengaged from the actuation member in order to allow its actuation. <IMAGE>
