Abstract (en)  
[origin: DE19733106A1] According to the method provided for in the invention, a measurement value (TQ\_MES) of an actual torque is determined. An estimated value (TQ\_AV) of the actual torque is determined according to the operating variables of the internal combustion engine. A corrected value (COR) is calculated on the basis of the estimated value (TQ\_AV) and the measurement value (TQ\_MES) of the actual torque. A set point value (TQI\_SP\_MAF) of the torque to be controlled by means of the air mass flow is determined according to a pedal position (PV) determined by a pedal position sensor (61), calculated using at least one other operating variable and corrected according to the corrected value (COR).
