Abstract (en)

[origin: DE19733800A1] The invention concerns a method for producing a tray-like element (4), by over-moulding technique, said element comprising a deposit surface having at least an antgliss coating (7). The invention aims at reducing the number of steps of this process and the work required for producing said deposit surface. For this purpose, the antgliss coating (7) is taken, in the form of a strip (6), from a storage device (5) then a part (6.1) designed to be over-moulded is inserted in the injection mould (3) where it is directly over-moulded, i.e. without support sheet.
