Abstract (en)

[origin: EP1002596A1] First (19) and second (26) press members are used for the stepwise, periodical advance of a strip-form workpiece, the first of which exerts periodical pressure on the workpiece (17) whilst the second is periodically driven, working in conjunction with the first. The first and second members periodically clamp and advance the workpiece between them. A periodically movable first securing member periodically presses the workpiece against a second securing member, securing it for a short period. On a drive shaft (3) is a longitudinally displaceable curve pendulous gear (2), which is in work connection at least with the second press member (26). A single cam plate is connected with the drive shaft (3) and which is connected by a transmission rod (25) both with the first press member (19) and the first securing member.
