Abstract (en)

[origin: EP1002628A1] The cutting part (34) is wider (b) in its center part between its outer free end (40) and its angled transition (38) to the interval join (36) than its width (c) at the transition itself (38). The cutting part edge is convexly curved relative the receiving hole (18), using one edge as blade. Otherwise the part (34) has a straight or convex edge facing the hole (18) as well as a second edge which faces away from the hole (18), is bent straight or convex in relation to this hole (18), but again uses one edge as blade. The radial distance (a) to the hole (18) center (48) should increase from transition (38) to the outer end (40) which in one variant comes to a point formed by the converging blades.
