Abstract (en)
[origin: EP1002993A2] The burner of the boiler is designed as a pre-mixing burner, whereby fuel is vaporized in the evaporator(2) and mixed with air into a mixture conducive to combustion and which is then introduced into the flame producer(4). The flame producer is installed concentrically inside a cylindrical first ebullator(11). The pre-mixing burner is connected preferably detachably to a part(5) of the boiler accommodating the ebullators(11,13). A deflector(14) is provided preferably above the first ebullator and an additional ebullator(13) is installed preferably radially outside the first ebullator.
