Abstract (en)

[origin: DE19812660A1] The invention relates to a two-component container (1). According to the invention, two chambers (6, 7) can be connected by expelling a stopper (5). The stopper (5) can be pushed out of the element (14) holding it in place by screwing one container (3) into a thread (4) which is connected to another container (2). An intermediate piece (19) is provided between the two containers (2, 3). Said intermediate piece (19) rests on the upper edge (21) of the lower container (3) with a support (20). A sealing lip (30) between the connecting piece (10) and the intermediate piece (19) can be elastically, outwardly set back so as to produce a valve effect with excess pressure in the two-component container (1). The inventive two-component container (1) is suitable for storing peroxide and hair colorant separately.
