Abstract (en)

[origin: WO9954593A1] A device for producing a sealing arrangement consists of two components (11) which meet and a sealing profile (8) which tightly bridges the gap between the two components. Said components (11) are especially segments which together form a tubular tunnel. The device is characterised in that a vacuum device comprises the following parts: a mounting groove (1) for the sealing profile or sealing frame, said mounting groove (1) being provided with at least one integrated parallel vacuum groove (3, 3'); at least one, usually several vacuum bores (4, 4', 4'') located at intervals and connected to the vacuum groove (3, 3'), a distributor line which is shaped especially as an annular line (12) when a sealing frame is fixed in place, a connecting line (16) which connects the distributor or annular line (12) to the vacuum bore and a main line (13) which is connected to the distributor or annular line (12) and which leads to the vacuum assembly (14).
