Abstract (en)

[origin: WO9909729A1] A method for locating stored entries in an electronic directory, said directory containing a plurality of entries each comprising a name field and an associated telephone and/or telefax number field, comprises the steps of receiving information concerning a predefined number of characters of a name, identifying all entries in said directory whose name fields match said information, and, if more than one entry has been identified, receiving further information to select a single entry from the identified entries. A communication apparatus is adapted to perform this method. The method and apparatus of the invention enable a user of a telephone to easily find stored entries in an electronic directory.
