Abstract (en)  
[origin: EP1004721A1] A connecting tube bend (14) in a device for distributing loose material on a surface (25) has one end connected to a material feed tube (13). Its other end is connected to a support tube (10) rotatable around an axis virtually vertical to the surface. To the support tube a distributor tube (21) is connected for ejecting material and is rotatable virtually parallel to the surface. The connecting tube bend is firmly connected to a table (11) positionable on the surface. The feed tube (13) locates on the surface and on the support tube at least one support with at least one roller (1) is fitted. The roller locates on the table and by rotation of the support tube rolls on the table.
