Abstract (en)
[origin: EP1004743A2] The blind has two spaced wall holders (2) fixed on the building wall and each comprising a first base part (11) with connector (19,21) on one of its flat sides (13), and a second plate-like bearing support (12) with bearing seat (49) on its flat side and a second connector (39) on its narrow side. A winding shaft fits between each two bearing supports (12) and the blind panel is fixed with one edge on the winding shaft and the other edge on a drop rail. The winding shaft is driven by a drive mechanism to raise and lower the blind. The base part (11) has two parallel flat sides of which one faces the wall or building structure and the other supports the first connector. The base part is first fixed to the wall and then the bearing support prefitted on the winding shaft is connected to the base part.
