Abstract (en)

[origin: WO9834573A1] An ostomy device comprising an ostomy bag, the ostomy bag being adapted to be attached to the body of a user by means of at least two pads directly and/or indirectly attached to the bag, the at least two pads comprising a first pad surrounding the ostomy opening and a second pad distinct from the first pad. The second pad is typically larger than the first pad and provides a support function, thereby reducing the risk of detachment of the bag. The device may also comprise additional attachment pads distinct from the first and second pads.
