Abstract (en)

[origin: FR2767514A1] The container has two compartments, one formed as a flask (1) and the other as a seal (4) which is shaped to connect with and be able to be displaced into the flask. In this way the two compartments come into contact with each other. This is activated under the action of a stopper (10) that can be perforated and is displaced in the neck (2) of the flask against the against the force of an elastic retainer (14).
