Abstract (en)
[origin: WO9908055A1] The invention relates to a method of producing cooling power for one or more buildings by means of hot district heating water and an absorption aggregate (5, 8, 9, 10) obtaining energy from the district heating network. To provide a compact solution, the absorption aggregate (5, 8, 9, 10) is designed in view of a power that is lower than the peak consumption. When the consumption exceeds the design power, the temperature of the water discharged to the boiler part (5) of the absorption aggregate is raised by means of an external source or sources of heat (26).
