Abstract (en)

[origin: EP1005915A1] Dispenser assembly for substance in two or more phases has pump operating without drawing in air and substance container in supple pouch. The assembly consists of a variable-volume container (2) surmounted by a pump (13) that operates without drawing in air and holding a product in at least two non-miscible phases (A, B) of different densities, and with at least one of the phases being a liquid. The container is in the form of a supple-walled pouch inside a rigid vessel (10), with a neck (18) shaped to prevent the pouch outlet from being blocked as its volume reduces.
