Abstract (en)

[origin: DE19710723C1] The invention relates to a device for the continuous production of plate-shaped products, comprising two endless strips (10, 12) which are positioned one above the other and can be driven. A working gap (18) is formed between the sides of said endless strips, said sides being adjacent to one another and each being conveyed via a support surface (14, 16). The starting material (20) for processing is conveyed through said working gap (18) which is bordered on each side by an accompanying strip (30). Said accompanying strip (30) is situated along said working gap (18) between the two endless strips (10, 12) and moves with them, consisting of a flexible sealing strip (36) which has a friction surface (38) on at least one face, said face facing towards an endless strip (12). Said friction surface (38) increases the static friction between the flexible sealing strip (36) and the endless strip (12).
