Abstract (en)  
[origin: DE19709643C1] The paper folding system has a block of folding rollers (5-8) and magazines (11,12) above and below the block to take the part folded sheets between fold operations. The input and output feeds of the block are in the same plane. This allows the folding block to be fitted either way up, and enables two types of folding pattern to be obtained without changing the input and output drives. In the one setting the first folding roller is below the feed line and in the others setting it is above the feed line. The drive for the block comes from a motor (24) and from selective gear wheels which couple to all or some of the folding rollers.
