Abstract (en)

[origin: WO9910957A1] Cable ladder sections, respectively cable path sections (10), are adapted to be assembled, possibly through the intermediary of bends/elbows, to form cable ladder/cable path systems. Said sections (10) are provided with cavities (16), the defining portions therefore constituting fasteners for the attachment of cables (24), conduits, pipes tubes, hoses, etc., preferably by means of locking bands/strips (22) which, from an open position, can be closed, stretched, tensioned and locked around a cable (24), etc., and at least one fastener. In order to facilitate the fastening of the locking bands (22) to the fasteners as well as enabling this attachment also when the space at one side of the cable path section/cable ladder section is not available, said fasteners are each shaped and designed as freely projecting fingers (20), the free outer end thereof pointing in the longitudinal direction of the respective section (10).
