Abstract (en)

A conveying system for sheet-like objects, such as for example banknotes, comprises at least one conveyance channel and means for generating an air flow in said conveyance channel. The conveyance channel is of substantially rectangular cross-section. The opposed inner walls having the larger dimension are provided with means which influence the air flow generated in the conveyance channel in such a manner near the inner walls that an air flow directed away from the inner wall in question is generated near each of said inner walls. <IMAGE>
