Abstract (en)

The present invention relates to a cap for sealing lead-throughs made for pipes and other tubular elements penetrating roof coverings. Such a cap usually comprises a flange section (1, 13) and a sleeve (4, 14) arranged to protrude from the flange section. It is intended particularly for sealing lead-throughs which are situated in steep roofs or which become wider above the roof. The flange section is arranged to surround the sleeve (4) that tapers off at its end, and the sleeve is mounted in the flange section by means of deep corrugations (5) extending in opposite directions. Such corrugations enable sharp turning of the sleeve with respect to the flange section without any tearing of the sleeve. Therefore the invention is applicable for use at any roof pitch and with any diameter of a lead-through. <IMAGE>
