Abstract (en)
[origin: US6579251B1] A versatile and highly effective massage device has an active surface for bringing into contact with tissue to be treated, and means for driving the active surface in an oscillating pivoting movement about an axis. The active surface has, in cross section, different radii perpendicular to the axis in different directions and can be rotated parallel to the axis in order to bring in each case different zones of the active surface into contact with the tissue.
