Abstract (en)

[origin: WO9841356A1] The invention relates to a method for treating the surfaces (I) of component bores, especially for treating the tracks (I) of cylinder bores (B1, B2, B3, B4) of engine blocks (M) with a laser beam (X) which is directed at the surface requiring treatment by means of deflecting optical device (100), and a device intended for said treatment. Said devices enable the surfaces of component bores to be treated easily, with greater precision and improved efficiency. The inventive method is characterized in that during the treatment process the component (M) is rotated around a rotational axis which is aligned paraxially with the longitudinal axis of the bore being treated whilst the deflecting optical device (100) remains stationary. Any imbalances which appear when said component (M) is rotated are corrected by correction gauges (21, 22).
