Abstract (en)
[origin: WO9901816A1] A method, an apparatus, and a computer-readable medium for performing a discrete-event simulation employ an event list comprising events. In the event list, one event is indicated as a head event, and each event is indicated as uncomputed, pre-computed, or in-computation. An uncomputed event is selected and transferred to one of at least one event pre-computation processes, which computes a computation for the selected uncomputed event. An uncomputed head event is executed, and a pre-computed head event is verified.
