Abstract (en)

A voltage-regulator circuit for the electromagnetic driving of the valves of an internal combustion engine is described and comprises: an energy-storage capacitor (C) for coupling to a current-recirculation network (14) associated with at least one respective actuating coil (16) for each valve, and a switching current-regulator circuit (10) disposed between a direct-current power supply (12) and the capacitor (C). The voltage-regulator circuit is arranged to operate as a booster of the voltage from the power supply (12) towards the recirculation network (14) and as a reducer of the voltage from the recirculation network (14) towards the power supply (12). <IMAGE>
