Abstract (en)

[origin: WO9810823A1] A bandage (10) for fixating a cannula (40) of a venous catheter relative to a skin surface part of a person comprises: a supporting element (18) to be arranged adjacent to the perforation aperture and below the cannula (40) for supporting the cannula, a connecting foil (25) defining a cover foil area, a cover sheet (12) of foil material having opposite first and second surfaces, the first surface of the cover sheet defining an area substantially exceeding the cover foil area, and an adhesive material applied to the first surface of the cover sheet. The supporting element (18) is connected to and supported by the connecting foil (25) which defines a transition area (28) between the supporting element and the cover sheet, as a folding line is defined within the transition area. The cover sheet (12) is foldable onto the supporting element (18) along the folding line for covering the cannula, for covering the perforation aperture, and for arranging the first surface of the cover sheet facing towards the supporting element, covering the supporting element and the connecting foil, adhering to the skin surface part and fixating the cannula onto the supporting element.
