Abstract (en)

[origin: WO9912814A1] The invention relates to a labelling station characterized in that the labels which are held by the receiving surface (2a) of a removal member (2) are marked by means of a writing laser (7a) in a marking device (7). In order to execute such a marking on the whole length of the label, it is provided that the rotary motion of the removal members (2, 3) located before and behind the label container (5) be directed in such a way that enough free space remains between the removal member (3) located before the label box (5) and the latter (5) to enable the laser to run almost vertically on the whole writing length of the label held by the receiving surface (2a) of the other removal member (2).
