Abstract (en)

[origin: WO9913353A1] The invention relates to a method and system for detecting and signalling a change in the location of an object operated at a fixed site, especially a cash machine or safe, in relation to its place of operation. The location data of the place of operation are stored in a memory. Using a position indicating system the position data of the object are repeatedly determined anew and compared with the stored location data of the place of operation. A signal is triggered if the difference between the two exceeds a predetermined value.
