Abstract (en)

[origin: WO9948330A1] A hearing aid, in particular an in-the-ear hearing aid, which comprises a very compact housing (1), which accommodates an electronic circuit (11) and a battery compartment (5). A faceplate (3) includes a lid-shaped element (7) which can be moved with respect to the battery compartment, the battery compartment being closed in a closed position of the lid-shaped element, and the battery compartment being accessible in an open position of the lid-shaped element. A detector (9) is secured to the lid-shaped element, which detector is embodied so as to be suitable for the wireless reception of signals and conversion thereof to electrical signals. The hearing aid is provided with an electrical connection means (13a, 13b) which, at least in the closed position of the lid-shaped element, connects the detector to the electronic circuit.
