Abstract (en)

[origin: EP1013866A2] A road vehicle window pane connected to an accommodation is connected to a window raiser by a device involving at least one driver (2) connected to guide and transport devices of the window raiser. The driver is connectable to the pane accommodation by positively interengaged components (21,41,42,28,38), which are separated from each other in pairs, and on connection of the window pane with the raiser, come into engagement one after the other. A first pair of positive engagement components (21,31) bring together and/or align the driver and the pane accommodation (3), and a second pair of such components (41,42) locks the connection of the driver and the pane accommodation.
