Abstract (en)

The independent system of lubrication comprises essentially pump (3) which feeds the lubrication oil which is sucked by means of piping (4), reservoir (5) and is sent to motor (1) by means of piping (6), the latter being connected to the conduit of entry (7) of the combustible in the same motor. The system is characterized by the fact that it is applied and utilized for the lubrication of an internal combustion motor having a two-stroke engine, initially constructed and functioning with the liquid combustible called "mixture" and which subsequently is fed with the gaseous combustible (GPL) which is a gas from liquefied petroleum, methane and similar gases. <IMAGE>
