Abstract (en)

[origin: WO9914366A2] The invention relates to the field of cancer diagnosis, more specific to the monitoring of disease development during and after treatment. The invention comprises a method for determining minimal residual disease comprising amplifying nucleic acid molecules using at least one primer reactive with a common gene segment and further comprising identifying malignancy-specific nucleic acid sequences by hybridising with a fluorogenic probe specifically and selectively reactive with said malignancy-specific nucleic acid sequences.
