Abstract (en)

[origin: WO9914411A1] A device for tensioning warp threads on a drawer-in for warp threads has a substantially vertical frame (1) for tensioned warp threads arranged next to a warp thread cutting device (13) arranged in a marginal region of the frame. In order to provide a simple and light device of said type, in which the warp threads to be cut and the warp thread cutting device are positioned as precisely as possible relative to each other, the frame is movably mounted in a marginal region (16) and is guided by a fixed roller (19) so as to move in the direction of the main axis (22) and in a direction perpendicular thereto. In another marginal region (12), the frame is directly linked to the thread cutting device so as to move in the same direction as the latter.
