Abstract (en)
[origin: EP1017079A2] An auxiliary device for opening a circuit breaker associated therewith if the supply voltage is lower than a threshold, comprising an insulating enclosure which contains a fixed magnet on which a coil is wound, a moving magnet and connecting terminals, further comprising: actuation means which are operatively connected to and actuated by the moving magnet; a kinematic chain operatively connected to said actuation means; means for coupling to the circuit breaker which are operatively connected to the kinematic chain; means for the local visual indication of the open state of the circuit breaker due to a condition of supply voltage lower than a threshold, actuated by said actuation means.
