Abstract (en)

[origin: EP1017106A2] An image sensor having a plurality of pixels arranged in a series of row and columns comprising a semiconductor substrate having a plurality of pixels formed in rows and columns with at least two pixels that each have a voltage to charge conversion region that are spatially isolated from each other and electrically connected to the source of a single reset transistor. The pixels that share a reset transistor can also share an amplifier, and a select electrical function. The preferred embodiment envisions adjacent pixels, although, immediate adjacency is not a requirement. <IMAGE>
