Abstract (en)
[origin: WO9915184A1] The described invention relates to the treatment of hyperexcited sensory nervous function, e.g. neuropathic conditions in human subjects. The treatment is performed without inflicting painful side-effect to the patient, comprising intrathecal administration of the endogenous compound adenosine in a combination with a low dose of a local anaesthetic agent. It is demonstrated that the drug combination can intrathecally repeatedly be administered, providing inhibition of neuropathy without inducing side-effects from any of the two agents involved.
