Abstract (en)

[origin: EP1020367A1] A package in the form of a box comprises a hollow body (1) defined by a plurality of walls which include a pivotable wall (13a) articulated along a peripheral edge (3d) of a first wall (3) so as to be able to adopt a closed position and an open position relative to an access opening to the interior of the body (1). A second wall (5) opposite the first wall (3) and having an associated hanging portion (14a, 14b) projects from the body (1) and carries means (16) for the engagement of the package on a support device. The hanging portion (14a, 14b) is connected both to the pivotable wall (13a) and to the second wall (5) of the body by separable connection means (5d, 5e). The separation of the hanging portion (14a, 14b) from the body (1) renders the pivotable wall (13a) independent of the second wall of the body (5) so that the pivotable wall can adopt the configuration in which the access opening is open. <IMAGE>
