Abstract (en)

[origin: EP1020786A2] The arrangement converts a pivoting motion into an electrical signal and has a fixed rod (3a) with a handle element (2) on its free end that can pivot in the x, y and z directions. The rod has a bulge (7) with a spherical surface enclosing the rod below its free end and held in a bearing shell (6) for the handle element. Two mutually orthogonal forks (12,20) are pivotably mounted in the handle element and have longitudinal slots for the free rod end to pass through and an arrangement (16-19) for generating an electrical signal.
