Abstract (en)
[origin: WO9919222A1] A container (1) for dispensing liquids comprises a non rigid first chamber (2) formed by welding together two sheets of plastics material and a second rigid chamber (3) located within the first chamber (2) and isolated therefrom by the walls of the second container. The second chamber (3) is provided with a membrane (5) which is welded between the two sheets of plastics material of the first chamber (2) to secure the second chamber (3) in place. An aperture (4) is provided in a wall of the second chamber (3) to provide a fluid communication means between a region of the first (2) and a region of the second (3) chamber. A tuck (14) of plastics material is provided in the base of the first chamber (2) to form a substantially horizontal base when the first chamber (2) is filled. A plastics block (14) is provided integral with the second chamber (3) having a fluid dispensing means (13) extending therethrough closable by means of a cap (8).
