Abstract (en)  
[origin: EP1022101A2] The slicing machine has a cutter-blade housing (1) on which a rotary blade (2) is removably fixed. The outer edge of the blade forming the cutter is partly enclosed by a cover (30) also removably fixed to the housing. The cover is mounted between the housing and cutter-blade when the slicer is assembled and has a seal partly enclosing a central opening in the cover. A cog wheel (3) driven by the motor is positioned in the housing and pivotally fixed on an axle (4). A holder plate (6) is fixed to the side of the blade facing the housing. Drive elements (8,9) on the holder plate and cog wheel protrude through the central opening in the cover.
