Abstract (en)

[origin: US6425851B1] A device and process are provided for activating objects, i.e., substances, organic and inorganic materials or living plant, animal or human bodies and parts thereof, which takes into account the effect of the Earth's magnetic field. An object to be activated is screened from external magnetic fields, such as the Earth's magnetic field or artificial magnetic fields caused by electrical equipment and subjected to a defined constant or variable magnetic field. Activation then takes place by defining a magnetic environment in the spatial region of the object. The weak magnetic field produced by the device may be constant, or may be changed with time since a human body also moves in the Earth's field and is therefore subjected to different field values and field directions.
