Abstract (en)  
[origin: DE19748665A1] The invention relates to an anti-vibration device, e.g. for the drive train of a motor vehicle, whereby an electric motor (4) is arranged in front of an anti-vibration device (6) in said drive train. The electric motor (4) is used to apply torque to the input shaft (2) or the output shaft (10) in such a way that the anti-vibration device has an enhanced or reduced elastic rigidity with respect to the torque induced by the other shaft (10 or 2).
