Abstract (en)  
The cushion comprises a padded core (2) and a cover (3) that is closed by means of a zipper or other conventional means in order to maintain the padded core (2) inside it. It also comprises one or more pairs of buttons (5) face to face, the buttons of each pair being on the outside of the larger surfaces of the cushion, said two buttons being connected in order to press the area where the buttons are located and to define the corresponding recess on each one of the two larger surfaces of the cushion. The connection of both buttons (5) is carried out as of a string (7) transversal to the padded core (2), this string having in its ends a fastening element (6) for the respective button (5) each fastening element (6) being located on the outside surface of the padded core (2), for the purpose of permitting snapping, and/or liberation, by pulling, of the button (5) for which purpose the button has on its inside part an element (8) complementary to the fastening element (6). The buttoning-unbuttoning means of the buttons (5) permit the release of the cover (3) from the padded core (2), without the need to handle in any way the strip (7), nor the fastening elements (6). <IMAGE>
