Abstract (en)
[origin: WO9920099A1] A handle (2) for hand saws with elongated toothed saw blades comprises a rear gripping part (3) and a front fastening part (4) to which the saw blade can be connected with one end. The gripping part (3) connects to the fastening part (4) via a transition part (6) which is narrower than the fastening part, causing a lower portion (4') of the fastening part to extend below the transition part to define a concave recess (7) with a depth basically corresponding to the normal width of a human second finger, thereby locating an imaginary straight line extension of the tooth line (5) of the saw blade to the region between the second and third fingers of the gripping hand.
