Abstract (en)

[origin: WO9924761A3] The present invention relates to an air-conditioning method intended for measuring rooms (10) including a floor (11), a plurality of walls (12) and a ceiling (13), wherein said method uses at least one air-conditioning (30) device which is preferably located above the ceiling. This air-conditioning device (30) supplies conditioned air into the measuring room (10) through fresh-air openings (52) preferably located in one area of the ceiling. After circulation in the measuring room (10), the fresh air which is now contaminated is discharged through at least one contaminated-air opening (60) and can be at least partially re-directed to the air-conditioning device (30). This air-conditioning device is characterised in that an air guiding system located below the ceiling (13) comprises at least one fresh-air opening (52) which is directed towards the walls (12) for directing the conditioned air delivered by the air-conditioning device (30) towards said walls (12).
