Abstract (en)  
[origin: WO9924761A2] The present invention relates to an air-conditioning method intended for measuring rooms including a floor, a plurality of walls and a ceiling, wherein said method uses at least one air-conditioning device which is preferably located above the ceiling. This air-conditioning device supplies conditioned air into the measuring room through fresh-air openings preferably located in one area of the ceiling. After circulation in the measuring room, the fresh air which is now contaminated is discharged through at least one contaminated-air opening and can be at least partially re-directed to the air-conditioning device. This air-conditioning device is characterised in that an air guiding system located below the ceiling comprises at least one fresh-air opening which is directed towards the walls for directing the conditioned air delivered by the air-conditioning device towards said walls.
