Abstract (en)

[origin: EP1029790A2] A block of upright flat package blanks is gripped by a grip bracket for movement between stations. Work piece carriers (WT) with chambers (K) move on a conveyor. The chamber is open at both ends and the two open ends are connected via a continuous slot in one of the three other sides, forming a C- or U-shaped profile for a block of package blanks (VM). The bracket with its grip tools (Sp) moves a block in a translatory movement relative to the chamber along the open slot, and moves individual package blanks from a feeder station of a chamber to a neighboring filler machine.
