Abstract (en)

A new tasting system is proposed to taste beverages, in particular alcoholic drinks, through their nebulization in the oral cavity. In general, this new system makes use of a spray can (1) comprising a container such as a can or bottle and an upper atomizer. The beverage, which is preferably but not exclusively an alcoholic drink, is therefore sprayed out through a hole by pressing a piston. This particular type of spray distributor for beverages or the like containing preferably alcohol is used to nebulize the drink inside the oral cavity by directing the spray jet towards the open mouth and pressing the piston. <IMAGE>
