Abstract (en)
[origin: EP1029997A2] A pivotable lifting device (12) mechanically connected to the border profile (8), and a horizontally movable coupling piece (13) mechanically connected to the lifting device are mounted in the frame for each wall element. Once the adjacent wall elements have been slid together, the coupling pieces can be moved using a drive unit in an adjacent wall element, and the border profiles can be moved in a vertical direction. The wall comprises a number of wall elements suspended from a rail, each comprising a frame and at least one panel. At least one vertically movable border profile is present, the movement of the profile being achieved using a lifting device activated by a coupling piece. The border profiles can be clamped between the floor and ceiling.
